

## What you should click to activate fax capability

When you see **many entries with the word “Fax”**, that means you’re in the right place. The feature you want is:

### ✓ Fax Services

If you see any of these, enable them:

- **Fax Services**
- **Windows Fax and Scan**
- **Fax Server** (rare, usually on Pro/Enterprise)
- **Fax Service API** (optional, but harmless to enable)

Turn on the main **Fax Services** checkbox — that’s the core component that allows Windows to send/receive faxes: fax server.

After enabling it:

1. Click **OK**
2. Let Windows install the components
3. Restart if prompted
4. Open **Windows Fax and Scan** from the Start menu
